13	Markdown Table Rendering (GFM table	Y	1	11
	TOTALS	**13/13**	**8**	**22**

Notes:

- #2 Specialty Identification (NUCC + AI expansion)
 - DEFERRED: Sufficiently working for release. Deep testing deferred - too complex for alpha.
- #3 Clinical Trials Search
 - Enhancements (2):
 - Travel distance + drive time via Google Routes API
 - Two-pass UX: results first, travel on request
- #4 About ChatHealthy / Skip Snow
 - Bugs (1):
 - Sonnet answers questions outside context instead of saying I don't know. Fix: PreScreen class (Sprint 2)
- #5 Safety Filter (dual-trigger, IP lock, audit)
 - Bugs (3):
 - False positive on provider name lookup (safe-prefix bypass added)
 - Unlock code visible in audit record (deidentify added)
 - Triggering message missing from audit history (append current msg)
 - Enhancements (2):
 - Switched classifier to GPT-4.1-mini (vendor diversity, 2.5x cheaper)
 - Full de-identified conversation history in safety audit trail
- #7 Consent Framework
 - FAIL: Two consent streams needed: Stream 1 (questions) always de-identify. Stream 2 (contact me) user chooses verbatim
 - Bugs (4):
 - Sonnet set consent_verbatim=true when user asked for de-identification
 - PII not scrubbed when de-identify was requested
 - Exact consent wording needs legal review before beta
 - No separation between question consent and contact-me consent
- #8 Provider Detail
 - FAIL: External link quality unreliable. Full fix deferred.
 - Bugs (2):
 - Healthgrades fuzzy match returns wrong provider

- Zocdoc blocks all third-party links (403)
- **Enhancements (2):**
 - NPI Registry API lookup for real provider data
 - Repositioned links as research sites with user guidance
- **#9 URL Guardian (validate + defang broken links)**
 - DEFERRED: Link check deferred to next build. V2 design ready (3-stage: HEAD, AI content verify, Google search correct)
- **#10 Chat UX (timer, stop, markdown, emergency)**
 - DEFERRED: Sufficient for v0.1.2. Deep testing deferred.
- **#11 Blob Storage Infrastructure**
 - **Enhancements (2):**
 - Created admin + dev-brain containers
 - Consolidated provider-data into chathealthy-public-data
- **#12 Unanswerable Question Handling**
 - **Bugs (3):**
 - System answered unanswerable questions without recording (fixed: RULE 2 source-bounded knowledge)
 - Responses too verbose (fixed: template responses from tool)
 - Mid-session context caused rule bypass (fixed: evaluate each message independently)
 - **Enhancements (4):**
 - 3-path classification (healthcare capability / medical advice / irrelevant)
 - Template responses ? verbatim from tool, no Sonnet elaboration
 - Consent before recording questions
 - Follow-up offer after recording
- **#13 Markdown Table Rendering (GFM tables in chat)**
 - **Bugs (1):**
 - GFM tables not rendering (fixed: remark-gfm + sanitize whitelist)
 - **Enhancements (11):**
 - Bordered table cells
 - Repeating header every 7 rows
 - Notes section
 - DEF/FAIL status in Done column
 - Build number auto-increment
 - Summary counts in header
 - Removed deferred columns
 - Frontend fetches /welcome from API
 - QA Report header with build range + scenario summary
 - Column width fix (nowrap for short columns)
 - Structured notes with bugs/enhancements

Release Gate: GPT-4o Enterprise Architect: conditional-go | Risk: Moderate

Conditions: Consent framework (Sprint 2), Provider Detail links (Sprint 2), Automated tests (Sprint 2)
