Executive Summary

ChatHealthy.ai is a consumer-first healthcare navigation platform built around the full decision lifecycle: finding care, evaluating options, and deciding with others. Today, this journey is fragmented across search, provider directories, ratings sites, and private conversations. ChatHealthy unifies these steps into a single, governed system designed for clarity, trust, and collaborative decision-making.

The platform consists of three components. Find Care enables precise, intent-driven provider discovery. Evaluate Care builds trust through structured synthesis of provider quality and clinical options. Discuss Care introduces a new category: multi-human, multi-AI healthcare decision collaboration with shared tools, consent, and governance. This is where decisions are actually made.

The business model follows a platform approach similar to Apple: users pay for premium AI usage, and AI vendors pay for distribution into high-value healthcare decision contexts. ChatHealthy does not take revenue from the care chain. The result is a neutral platform that owns the healthcare decision room while aligning incentives across users and technology providers.

Mission: Help people make better healthcare decisions together.

Find Care

Find the right care, fast

Find Care is the entry point into the platform, enabling users to locate healthcare providers, specialties, and services using natural language. It combines vector search with healthcare taxonomy mapping to interpret user intent and return relevant providers across geographies. The system reduces friction in navigating complex healthcare systems and serves as the primary acquisition funnel.

Capabilities

- Natural language provider search
- Specialty and condition mapping
- Geographic filtering (DE, MS, VA expanding nationally)
- Provider detail lookup
- Healthcare navigation guidance

Pricing: free forever

Role: the funnel

Evaluate Care

Understand your options

Evaluate Care enables users to assess healthcare options through structured aggregation and synthesis of provider quality signals and clinical data. It translates complex, multi-source information into clear, consumer-comprehensible insights while preserving transparency and traceability of underlying data.

Capabilities

- Provider credential analysis
- Clinical trial discovery and matching
- Quality signal aggregation
- Comparative provider evaluation
- Explainable AI summaries

Patent Concept

Method for synthesizing healthcare provider quality signals using large language models to produce consumer-comprehensible provider assessments.

Pricing: free now, paywall post-trust

Role: trust builder

Discuss Care

Decide together

Discuss Care is a multi-human, multi-AI healthcare collaboration environment where decisions are made. Users invite family, friends, and caregivers into a shared session where all participants--human and AI--can access the same tools, data, and context. The system enforces healthcare guardrails, structured interaction, consent, and moderation to ensure safe, focused, and human-centered decision-making.

Features (13)

DC-01: Shared Chat Session -- Multiple humans collaborate in one AI-assisted session

DC-02: Invite System -- Link-based access with no account required

DC-03: Multi-Model AI -- Multiple AI models participate simultaneously

DC-04: Shared Tool Access -- All participants can invoke healthcare tools

DC-05: Healthcare Guardrails -- Scope enforcement, safety filters, emergency detection

DC-06: Session Transcript -- Exportable transcript for care teams

DC-07: Consent per Participant -- Independent consent control per user

DC-08: Participant Roles -- Host and peer roles

DC-09: Real-Time Collaboration -- Live synchronized interaction

DC-10: Session Persistence -- Sessions resumable via link

DC-11: Floor Control -- Moderated turn-taking with human precedence and dynamic ranking

DC-12: Presence Layer -- Humans use camera or image; AI uses brand avatars (non-human)

DC-13: Voice Mode -- Speech-to-text interaction with full floor control support

Floor Control

- Humans have default priority over AI participants
- Participants are dynamically ranked based on contribution quality
- Time-wasting behavior results in demotion in queue priority
- Constructive contributions restore priority over time

Pricing: premium tokens + vendor partnerships

Role: revenue engine

Value Chain

Find -> Evaluate -> Discuss

Users move from discovering providers (Find Care), to understanding and comparing options (Evaluate Care), to making decisions collaboratively (Discuss Care). Each stage increases context, trust, and engagement, culminating in high-value decision sessions.

Revenue Model

AI Token Markup

Users pay for premium AI participation in Discuss Care sessions

AI Vendor Access Fees

AI vendors pay for distribution into healthcare decision sessions

Evaluate Care Premium

Advanced provider insights and analytics behind paywall

No revenue is derived from providers, payers, or pharmaceutical companies. The model follows an Apple-style platform approach where both users and technology providers pay, preserving neutrality and avoiding care-chain conflicts.

Competitive Moat

- Regulatory willingness: AI vendors avoid FDA classification risk and HIPAA exposure; they require a neutral platform to operate in healthcare decision contexts
- Trust: consumer trust in healthcare decisions compounds over time and is difficult to replicate
- Data: longitudinal aggregation of provider, trial, and quality data
- Governance: multi-human, multi-AI safety, consent, and moderation framework
- Network effects: each session adds participants and behavioral signal
- Patent: LLM-based synthesis of provider quality signals

Competitive Landscape

No existing platform provides multi-human, multi-AI healthcare collaboration with shared tools, structured evaluation, floor control, consent management, and governance. Search engines, directories, ratings platforms, and AI tools operate in isolation and do not support real decision-making contexts. This category does not currently exist.

Investment Thesis

ChatHealthy.ai owns the healthcare decision room--the highest-value point in the care journey where choices are made. By controlling this layer, the platform becomes the gateway through which AI participates in healthcare. AI companies pay to be present in these decisions, creating a scalable, defensible revenue model. This is not a chatbot; it is the infrastructure for healthcare decision-making.

Timeline

2026-04-30 -- Alpha launch (Find Care + Evaluate Care)

2026-05-31 -- Discuss Care Beta Sprint 1

2026-07-31 -- Seed funding close

2026-08-25 -- Production launch

2026-09-20 -- Beta launch

Governance

- GOV-001: No care-chain revenue
- GOV-002: Single-tenant session isolation
- GOV-004: AI suggests, humans decide

Unified safety layer across all components including scope restriction to healthcare navigation, emergency detection, explainability constraints, participant-level consent, and moderated multi-party interaction in Discuss Care.
